

Python Regex Metacharacters in Hinglish

Python mein metacharacters special characters hote hain jo regular expressions (regex) mein pattern matching ke liye use hote hain.[cite:1][cite:5] Yeh normal text ki tarah treat nahi hote, balki inka apna special meaning hota hai.[cite:3][cite:7]

re module kya hai

Python regex ke liye re module use karta hai.[cite:10]

```
import re
```

Metacharacters samjho

[] - Set of characters

Bracket ke andar likhe gaye characters mein se kisi bhi ek character ko match karta hai.[cite:1]

```
import re
text = "hello"
print(re.findall("[a-m]", text))
```

\\ - Special sequence ya escape

Backslash special sequences start karta hai, jaise \d digit ke liye, aur special characters ko escape bhi karta hai.[cite:1][cite:5]

```
print(re.findall(r"\d", "Room 101"))
print(re.findall(r"\.", "hello.com"))
```

. - Any character

Dot kisi bhi single character ko match karta hai, newline ko chhodkar.[cite:1][cite:7]

```
text = "hello hero"
print(re.findall("he..o", text))
```

^ - Starts with

Caret pattern ko string ki shuruat se match karta hai.[cite:1][cite:5]

```
text = "hello world"
print(re.findall("^hello", text))
```

\$ - Ends with

Dollar sign pattern ko string ke end se match karta hai.[cite:1][cite:5]

```
text = "hello world"
print(re.findall("world$", text))
```

*** - Zero or more**

Star previous character ya pattern ko zero ya usse zyada baar match karta hai.[cite:1][cite:6]

```
text = "heo heoo heeeeeeo"
print(re.findall("he*o", text))
```

+ - One or more

Plus previous character ya pattern ko kam se kam ek baar aur usse zyada baar match karta hai.
[cite:1][cite:6]

```
text = "heo heoo heeeeeeo"
print(re.findall("he+o", text))
```

? - Zero or one

Question mark previous character ko zero ya ek baar match karta hai.[cite:1][cite:6]

```
text = "heo helo"
print(re.findall("he.?o", text))
```

{ } - Exact count

Curly braces se exact number of occurrences define ki jati hai.[cite:1]

```
text = "heoo heooo"
print(re.findall("he.{2}o", text))
```

| - Either or

Pipe operator do patterns mein se kisi ek ko match karta hai.[cite:1][cite:7]

```
text = "falls stays falls"
print(re.findall("falls|stays", text))
```

() - Capture and group

Parentheses pattern ko group karte hain aur matched part ko capture bhi kar sakte hain.[cite:1][cite:7]

```
text = "hello hello"
print(re.findall("(he)llo", text))
```

Common special sequences

Sequence	Meaning
\d	Koi bhi digit 0-9[cite:1][cite:5]
\D	Koi bhi non-digit[cite:5]
\s	Koi bhi whitespace[cite:5][cite:7]
\S	Koi bhi non-whitespace[cite:5]
\w	Koi bhi word character, jaise letters, digits, underscore[cite:5][cite:7]
\W	Koi bhi non-word character[cite:5]

Important tip

Backslash ke saath regex likhte waqt raw string use karna safer hota hai, jaise r"\d", taaki Python backslash ko alag se interpret na kare.[cite:1][cite:5][cite:7]

```
re.findall(r"\d", "123")
```
